- 51 -

- 2. The process of claim 1, in which the third time interval is about two years and the third time interval commences about two years prior to the date of calculation of the bad rates.
- 3. The process of claim 2, in which the first time interval is about three months.
- 4. The process of claim 2, in which the first time interval is about one year.
- 5. The process of claim 4, in which the one year first time interval coincides with a calendar year.
- 6. The process of claim 1, in which the second time period is about ninety days.
- 7. The process of claim 1, in which each loan vintage comprises at least 50,000 loan units.
- 8. The process of claim 1, further including:
 allowing an operator to set the durations of
 one or more of the first, second and third time
 intervals;

PCT/US98/13195

5

- deploying a general purpose computer for enabling the computer to automatically provide "yes" or "no" comparisons as to whether a given financial institution should choose to invest in a particularly identified loan vintage.
 - 9. The process of claim 1, including:
 developing a projection of bad rates for a
 plurality of said loan vintages by calculating
 probablistic bad rates for said plurality of loan
 vintages during a forward looking window extending over a
 fourth time interval, the projected bad rates comprising
 an early warning system whose results are depictable on
 the output medium.
 - of calculating the probablistic bad rates for said loan vintages is carried out by using a logistic regression formula.
 - 11. The process of claim 10, in which the logistic regression formula is

 $Log(P/(1-P))=A+(B_1*AGE)+B_1*CO+B3*D_1+B4*D_2+B_3*SCORE+B_6*NO SCORE)$ wherein, P is the predicted bad rate, AGE is defined as the age of the loan vintage and B₁ and AGE are row and

~ 53 ~

column vectors of a dimension matrix of a predetermined size, SCORE is a mortgage score from a credit bureau and CO, D_1 , D_2 and NO SCORE are dummy variables, and the coefficients A, B_1 , B_2 , B_3 , B_4 , B_5 and B_6 are estimated by running a model of the equation over a preselected loan portfolio.

10

5

1.0

- CO is assigned a value of one if the loan is current at the beginning of the third time interval and zero otherwise, the variable D_1 equals one if the loan is one month past due at the beginning of third time interval and is zero otherwise, D_2 is assigned a value of one if the loan is two months past due at the beginning of the third time interval and zero otherwise, and NO SCORE equals one if the loan has no credit score available at the beginning of the third time interval and zero otherwise.
- 13. The process of claim 10, wherein the fourth time interval is of the same duration as the third time interval.
- 14. The process of claim 1, wherein the loan units are closed loan units.

- 15. The process of claim 14, wherein the loans are mortgage loans.
- 16. The process of claim 1, including separating all loan units into different groups based on type and thereafter carrying out said separation of said loan portfolios into separate loan vintages based on each type of loan.

5

- 17. The process of claim 16, wherein the types include conventional loans, jumbo loans and government originated loans.
- 18. The process of claim 9, including separating all loan units into different groups based on type and thereafter carrying out said separation of said loan portfolios into separate loan vintages based on each type of loan.
- 19. The process of claim 18, wherein the types include conventional loans, jumbo loans and government originated loans.
- 20. The process of claim 1, in which the output medium is a graphical chart.

- 55 -

21. The process of claim 9, wherein the output medium is a graphical chart.

22. The process of claim 20, which includes creating the graphical chart by plotting a difference between the bad rates calculated for a preselected pair of loan vintages and including on the graphical chart an area of uncertainty.

- 23. The process of claim 22, wherein the area of uncertainty is selected as a +1 and -1 standard deviation of the difference in the bad rates for the preselected pair of loan vintages.
- 24. The process of claim 21, including plotting on the graphical chart the probablistic bad rates in the form of a first curve.
- 25. The process of claim 9, including developing a matrix link by calculating a bad rate of a preselected loan vintage as of a definite time within the fourth time interval.

- 56 -

- 26. The process of claim 25, including developing delinquency transition figures for selected ones of said loan vintages.
- 27. The process of claim 26, including developing the delinquency transition figures by counting the numbers of loans which have transitioned from (a) good to bad state; (b) bad to good state; and (c) a status as a loan.

- 28. The process of claim 27, further including counting the number of loans which have remained in a bad state and counting loans which have remained in a good state.
- 29. The process of claim 25, including calculating for at least one of the loan vintages matrix link results comprising a ratio of a predicted number of bad loans divided by a predicted number of new loans.
- 30. The process of claim 29, including plotting the ratio on the output medium.
- 31. The process of claim 9, including automatically providing yes/no decisions whether to

- 57 -

invest in selected loan vintages using the early warning system.

- 32. The process of claim 25, including automatically providing yes/no decisions using the matrix link system.
- 33. A process for analyzing and selecting loan portfolios, wherein each loan portfolio comprises a plurality of loan units, the process including the steps of:
- separating the loan portfolios into a plurality of loan vintages;

5

10

15

developing a projection of bad rates for the plurality of said loan vintages by calculating predicted bad rates for said plurality of loan vintages during a forward looking window extending over a predetermined first time interval, the predicted bad rates comprising an early warning system the results of which are depictable on a visually perceivable output medium, a loan unit being included in the bad rates when payments on the loan unit are in arrears for a time period greater than a second time interval occurring during the forward looking window, the first time interval being substantially longer than the second time interval.

- 58 -

- 34. The process of claim 33, in which the step of calculating the predicted bad rates for said loan vintages is carried out by using a logistic regression formula.
- 35. The process of claim 34, in which the logistic regression formula is

5

10

Log(P/(1-P))= $A+(B_1*AGE)-B_1*CO-B3*D_1-B4*D_2+B_3*SCORE-B_4*NO SCORE)$ wherein P is the predicted bad rate, AGE is defined as the age of the loan vintage and B_1 and AGE are row and column vectors of a dimension matrix of a predetermined size, SCORE is a mortgage score from a credit bureau and CO, D_1 , D_2 and NO SCORE are dummy variables, and the coefficients A, B_1 , B_2 , B_3 , B_4 , B_5 and B_6 are estimated by running a model of the equation over a preselected loan portfolio.

CO is assigned a value of one if the loan is current at the beginning of the first time interval and zero otherwise, the variable D_1 equals one if the loan is one month past due at the beginning of first time interval and is zero otherwise, D_2 is assigned a value of one if the loan is two months past due at the beginning of the first time interval and zero otherwise, and NO SCORE

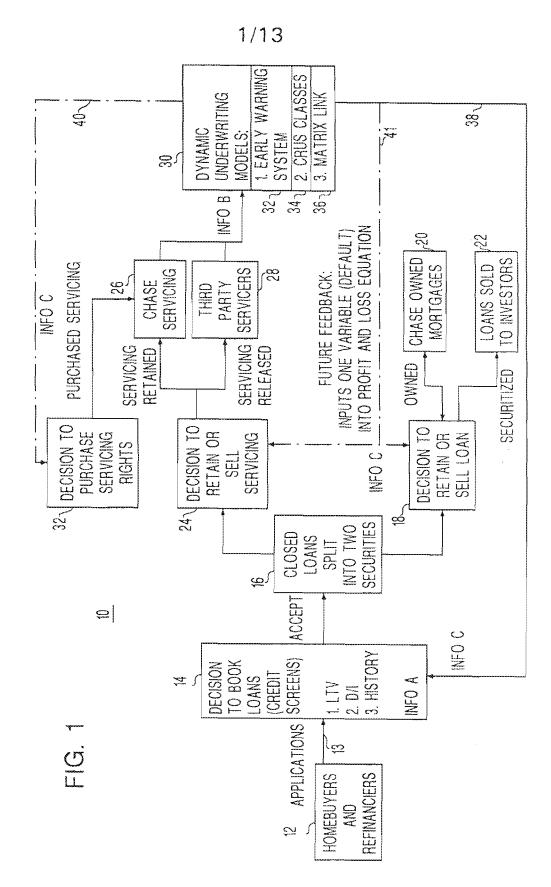

- 59 -

equals one if the loan has no credit score available at the beginning of the first time interval and zero otherwise.

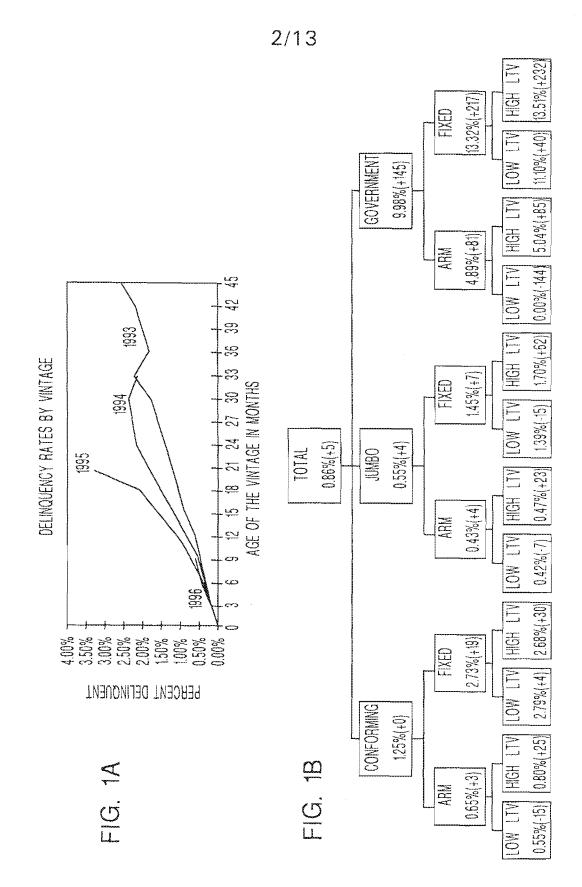

- 37. The process of claim 33, including depicting graphically in the form of a first curve an expected bad rate curve.
- 33. The process of claim 37, including producing a bar chart showing current mean bad rates and forecasted mean bad rates and superimposing the first curve over the bar chart.
- 39. The process of claim 38, including creating the first curve by creating a quarterly bad rate curve, smoothing the quarterly bad rate curve by averaging the values thereof with one another and further smoothing the curve by taking a risk ratio thereof.

5

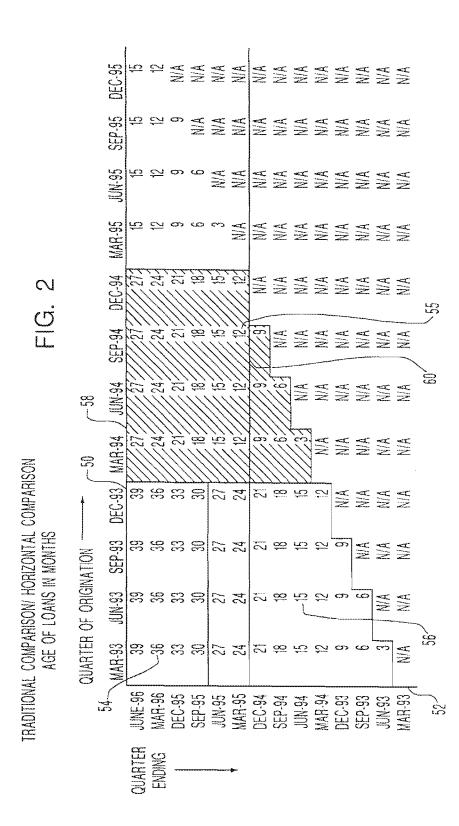

40. The process of claim 39, including creating markers on the curves including markers which show the changes in the first curve at a positive to a negative slope transition thereof and markers which show jump points of a predetermined size.
